## REPORT No. 215

### AIR FORCES, MOMENTS, AND DAMPING ON MODEL OF FLEET AIRSHIP SHENANDOAH

By A. F. Zahm, R. H. Smith, and F. A. Loudon

#### INTRODUCTION

To furnish data for the design of the fleet airship *Shenandoah*, a model was made and tested in the 8 by 8 foot wind tunnel for wind forces, moments, and damping, under conditions described in this report. The results are given for air of standard density,  $\rho = .00237$  slugs per cubic foot without  $VL/v$  correction, and with but a brief discussion of the aerodynamic design features of the airship. This account is a slightly revised form of Report No. 195, prepared for the Bureau of Aeronautics, July 22, 1922, and by it submitted for publication to the National Advisory Committee for Aeronautics.

Fleet airship Shenandoah of which two models were made and used in these tests

#### DESCRIPTION OF THE MODEL

The model during its first tests was 67.75 inches long, and was then shortened 3.28 inches by removal of a cylindric midship section to receive further tests. The external appearance of the shorter hull is given in Figure 1; the dimensions of both are given in Figure 2. During the test the long hull was first bare, then fitted successively with the controls 1, 2, 3, 4, 5, shown in Figures 4, 5, 6; the short hull was first bare, then fitted successively with controls 5, 6A, 6B, 6C, 6D; the latter shown in Figure 7. The bodies were of dry pine and varnished; the movable controls all were of brass; the thin fins Nos. 1, 3, were of brass; the thick ones of wood. The cross sections of the fins at their thickest point is given in Figure 3, and the areas of the various fins and controls are given in Table I.

The following classification of the controls has been furnished by the Bureau of Aeronautics:

- Type 1.—Original L-49 controls, flat surfaces.
- Type 2.—Similar to Type 1, but surface double-cambered.
- Type 3.—Flat surfaces, cantilever balance, area approximately 20 per cent greater than Type 1.
- Type 4.—Similar to Type 3, but surfaces double-cambered.
- Type 5.—Internally braced fins, "Handley Page" balance. Area approximately the same as Type 3.
- Type 6.—Movable surfaces A, B, C, D with common fins slightly larger than fins 5.

## METHODS OF TEST

During the tests for forces and moments the models were supported from the flange at the bottom of the wind balance shank, as shown in Figure 1, by means of a horizontal frame, from which fine wires ran to suspension points on the hull before and after its center. The mechanism and operation of this balance are described in Report No. 146 of the National Advisory Committee for Aeronautics. The head-on net drag so obtained was checked by measurements on the bifilar balance. In the part of the tunnel under the first named balance the wind has no static pressure gradient, hence correction for horizontal buoyancy for that region was not necessary, as it was for the space under the bifilar balance.

During some of the tests five components of the air force,<sup>1</sup> i. e., the lift, drag, cross-wind force, pitching and yawing moments, were measured simultaneously.

The damping coefficients were determined with the aerodynamic oscillator shown in Figure 8. The oscillator axle had a counterweight at one end, and at the other ran squarely into the hull at its buoyancy center.

The wind speeds and model settings for the various tests are sufficiently disclosed in the tables and diagrams accompanying this text. The oscillation values in the tables are faired from three or four sets of observations made for each condition of model and wind.

FIG. 1.—Model of fleet airship No. 1 suspended on wind balance

FIG. 3

## DRAG OF BARE HULLS

Tables II and III give the head-on drag and the shape coefficient for the bare hulls, long and short, as found for speeds of 20, 30, 40, 50, and 60 miles an hour; also the head-on drag and shape coefficient for 40 miles an hour, with control surfaces 1, 2, 3, 4, and 5. Figs. 9 and 10 show familiar graphs of the head-on drag and shape coefficients for the two bare hulls, at speeds of 20 to 60 miles an hour. At speeds of 40 to 60 miles the long hull has 2 to 3 per cent more drag than the short one, but has a perceptibly smaller shape coefficient, due to its greater volume.

<sup>1</sup> "Dynamie" may be used as the exact term for the entire urge of the air on the model. The dynamie can have three components of force, and three of moment; for example X, Y, Z, L, M, N. See Routh, Analytical Statics, Vol. I

FIG. 9.—Resistance and shape coefficient for long model, bare hull, at 0° pitch and 0° yaw

FIG. 10.—Resistance and shape coefficient for short model, bare hull, at 0° pitch and 0° yaw

The disk ratio and shape coefficient, as found at 40 miles an hour, are given for these two bare hulls and some earlier ones in the following table. The drag of a hull's major section, normally exposed as a thin disk, is taken as  $0.00283 SV^2$  pounds at  $V$  miles an hour, and the ratio of this force to the actual head-on drag of the hull is called the "disk ratio."

Comparison of various bare hulls

| Model                 | Disk ratio | Shape coefficient<br>$C_R = \frac{R}{\frac{1}{2} \rho (Vol.)^{2/3} V^2}$ |

## FORCES FOR VARIOUS ADJUSTMENTS

Tables IV to XV, inclusive, give, for numerous settings, the lift, drag, and side drag on the models, at 40 miles an hour, measured parallel to the axes of the tunnel and balance. Tables XVI to XXIII give the  $X$ ,  $Y$ ,  $Z$  forces thence derived by simple analysis. Figures 11 to 18 contain plots of the  $Y$ ,  $Z$  forces against angles of pitch and yaw. The  $X$  force is too nearly constant from model to model to justify plotting. Figures 14 and 18 show that the forces on the long hull can be closely estimated from the measured forces found with the short hull, thus obviating the need for repeating with the long hull many of the tests first made on the short one. In this estimate it is assumed that any air force increment due to adding the midship segment is the same when the hulls are bare as when furnished with either type of control.

FIG. 11.—Y force for long model with controls Nos. 1 to 5. Model at  $0^\circ$  pitch and elevators neutral. Air speed 40 M. P. H.

FIG. 12.—Y force for long model with controls No. 6. Model at  $0^\circ$  pitch and elevators neutral. Air speed 40 M. P. H.

FIG. 16.—Z force for long model with controls No. 6. Model at 0° yaw and rudders neutral. Air speed 40 M. P. H.

FIG. 17.—Z force for short model with controls No. 6. Model at 0° yaw and rudders neutral. Air speed 40 M. P. H.

FIG. 18.—Comparison of tested and computed Z force. Model at 0° yaw and rudders neutral. Air speed 40 M. P. H.

### MOMENTS FOR VARIOUS ADJUSTMENTS

Tables XXIV to XXX, inclusive, give the pitching and yawing moments, at 40 miles an hour, for the manifold conditions therein specified. Figures 19 to 25 contain plots of these moments against angles of pitch and yaw. Figures 22 and 26 show that the moments on the long model can be accurately estimated from measurements with the short one.

In this estimate the distance of the control force from the center of buoyancy of the short hull is computed as  $\Delta M / \Delta Z$ , where  $\Delta M$ ,  $\Delta Z$  are the increments of moment and force due to adding either type of control. This distance plus half the length of the midship segment is the arm of the control surface of the long hull. The product of this arm by the force on the control, plus the moment on the long bare hull, gives the total moment for the hull and control.

FIG. 19.—Pitching moment for long model about C. B. Bare hull and hull with controls, Nos. 1 to 5. Model at  $0^\circ$  yaw and rudders neutral. Air speed 40 M. P. H.

FIG. 25.—Yawing moment for short model about C. B. Bare hull and hull with controls No. 6. Model at 0° pitch and elevators neutral. Airspeed 40 M. P. H.

FIG. 26.—Comparison of tested and computed moments. Model at 0° pitch and elevators neutral. Air speed 40 M. P. H. Moment axis at C. B.

### FORCES AND MOMENTS AT LARGE ANGLES

Table XXXI gives, for the long hull with No. 5 controls all neutral, the drag, cross-wind force, and yawing moment in a 30-mile wind, on the model set at 0° pitch, and at yaw angles of 0° to 90°. The values of  $X$ ,  $Y$ ,  $N$ , derived from these data, are plotted against  $\psi$  in Figure 27. The vector diagram for this test is given in Figure 28. It shows that when the model is pivoted about the  $Z$  axis, as a weather vane, it is unstable in yaw at all angles below 70°. It is noteworthy that  $X$  becomes a propulsive force at large angles of attack, as has been observed in similar tests.

FIG. 27.—X and Y forces and yawing moments  $N$  for long model with No. 5 control surfaces. Model at  $0^\circ$  pitch. Elevators and rudders neutral. Air speed 30 M. P. H.

FIG. 29.—Center of pressure travel of long hull with No. 5 control surfaces. Elevators and rudders neutral. Air speed 30 and 40 M. P. H.

### CENTER OF PRESSURE

Figure 29 delineates the center of pressure in yaw for the data in Tables XXXI, XX, XXIX, also the center of pressure in pitch for the data in Tables XXII, XXV. As the yaw angle falls below  $10^\circ$ , the center of pressure runs rapidly forward, and travels even beyond the nose of the hull. The same effect is not observed in pitch because the fins are adjusted to give a negative pitching moment at zero pitch.

The forward travel of the center of pressure at small angles of yaw is further illustrated by Figure 30, giving the line of resultant air force on the long hull with Nos. 3 and 4 controls.

FIG. 28.—Line of resultant air force on long hull with No. 5 controls. Model at  $0^\circ$  pitch. Elevators and rudders neutral. Scale of model 1/120 full size

FIG. 30.—Line of resultant air force on long hull with Nos. 3 and 4 controls. Model at  $0^\circ$  pitch. Elevator and rudders neutral. Air speed 40 M. P. H. Scale of model 1/120 full size

### COEFFICIENTS OF DAMPING MOMENT

Tables XXXII to XXXIV give the data and derived values for finding the damping coefficient, and Table XXXV the net damping coefficient itself, for the long hull, first bare then with controls 1, 2, 3, 4, 6A, 6D. In Figure 32 these net values are plotted against speed, giving straight-line diagrams, as usual.

The logarithmic decrement,  $\lambda$ , used in computing the damping coefficients, was computed from faired plots of the oscillation data, made in pencil, for all the tests, during the individual runs. Some typical plots on semilog paper are shown in Figure 31.

The structure and theory of the aerodynamic oscillator used in these tests are well known, hence the method of finding the coefficient,  $\mu$ , of damping moment in the present work is omitted.

FIG. 31.—Oscillations at various airspeeds. Model at 0° pitch. Bare hull

FIG. 32.—Coefficient of damping moment in yaw vs. various air speeds. Model at 0° pitch. Elevators and rudders neutral

#### STABILITY CRITERIA

By (13), Report No. 212 of the National Advisory Committee for Aeronautics, an airship is stable in yaw if

$$a \frac{\mu}{u} \frac{Y_{\psi}}{N_{\psi}} > 1 \quad (1)$$

where all the symbols but  $a$  refer to the model conventionally. Following the earlier usage in aerodynamics, one may write  $a = s^3/m$ , where  $s$  is the scale ratio of airship to model, and  $m$  is the natural mass of the ship.

In the present case  $a = 120^3/5427 = 318.4$ , the denominator being slugs. The working yaw criterion then is

$$318.4 \frac{\mu}{u} \frac{Y_{\psi}}{N_{\psi}} \quad (2)$$

and gives for the full-scale hull the values listed in Table XXXVI.

The last column indicates that the airship is sufficiently stable with some of the types of controls, notably 3, 4. For experience with this kind of craft teaches that satisfactory stability may be expected when the yaw criterion here used somewhat exceeds  $1/3$ .<sup>2</sup>

Report No. 212, National Advisory Committee for Aeronautics, derives  $a$  in the form  $a = s^3/mn$ , where  $n$  is a constant peculiar to the model. For motion at small angles in yaw it appears that for this model  $n$  is less than  $1/2$ , and hence that the values of the criterion in the last column of Table XXXVI should be at least doubled. The value  $n=1$  was used in computing this table merely to make the values of the criterion directly comparable to those given in other publications, such as the one here cited. On the other hand, if one takes  $m=1.5 \times$  natural mass of the airship, and  $n=1/2$ , the value of  $a$  becomes  $1/3$  greater; and the given criteria must be increased by that amount.

<sup>2</sup> British R. & M. (new series) No. 361, p. 61.

## CONCLUSION

It is believed the designing staff, which initiated the program for the present measurements, will not require a detailed discussion of the data and diagrams, since these are of familiar form and very numerous. The stability criterion, presented in somewhat novel form in Table XXXVI, is derived and discussed in Report No. 212, National Advisory Committee for Aeronautics. If the numerical equations of motion for one or more of the present airship types be required, they can be developed subsequently in such fullness as may seem necessary.

TABLE XIV

NET MEASURED CROSS-WIND FORCE IN POUNDS FOR BARE HULLS AND HULLS WITH CONTROL SURFACES  
NOS. 1 TO 5

[Model at 0° pitch and elevators neutral. Air speed, 40 miles per hour]

[illegible]

TABLE XV

NET MEASURED CROSS-WIND FORCE FOR SHORT MODEL AND COMPUTED CROSS-WIND FORCE IN POUNDS FOR LONG MODEL WITH NO. 6 CONTROL SURFACES

[Model at 0° pitch and elevators neutral. Air speed, 40 miles per hour]
